Pre-delivery planning

For optimal results, Thermo goes to work long before the new system arrives. For most installations, we develop a Plan for Implementation which determines how best to integrate all Thermo equipment and, if present, third-party components (Thermo is not responsible for the performance of third-party equipment). This service includes optimizing the system layout and connectivity, and if desired, supervising site modifications and construction prior to delivery.

Starting out right

Installing a new system requires skill and experience to ensure proper performance. For situations in which a qualified end-user is not available, and you want to speed up implementation, optimize efficiency and accelerate the return on your investment, Thermo offers start-up services which include:

- Verification of performance in the intended application
- Verification of wiring and utilities
- Training users on proper system operation
- Working with licensing agencies as appropriate
- Checking for proper overall performance
- Checking the system for proper installation

When it's required

For some Thermo products, start-up inspection by a certified Thermo field service representative is a prerequisite for validation of the warranty. Ask your Thermo representative for more information when planning your purchase.
